

How the NSA has hacked YOUR PC

In spite of the fact there are a lot of tips on the Internet about how to protect your PC privacy and security, after you watch this terrific presentation from tech researcher and journalist Jacob Appelbaum, you might want to change your policy to either not care who knows anything about what you do, or not touching a PC, cell phone, or *ANY kind of electronic means of communication* again! Don't even use the postal system. Just stick to passing paper and ink messages only to trusted friends and family.

At December's Chaos Computer Congress in Hamburg, Mr. Appelbaum presented the latest documented revelations about how deep the NSA spying rabbit hole really goes. How do you know that the NSA has not hacked the BIOS of your motherboard? Or hacked the firmware of your hard-disk? You don't. There is no way you can even find out.
